| S5 | Overview on RAC exceedances of the 78 compounds with more than 1000 | |
| | measurements | 330 |

1 Data Cleaning

Before combining into a common database, more than 30 datasets have been cleaned and homogenised separately. Cleaning steps comprised the following steps (Figure S1 gives a graphical overview):

- 1. Structure: Datasets have been adjusted to the database structure.
- 2. Coordinates: Coordinates have been transformed to a common Coordinate Reference System (DHDN / 3-Grad Gauss-Krüger Zone 3 (EPSG:31467)) and duplicates merged.
- 3. Chemicals: Chemical names and identifiers have been unified using the webchem package (https://github.com/ropensci/webchem).
- 4. Identifiers: Unique identifiers have been assigned.
- 5. Units: All concentrations have been converted to $\mu g/L$. Values below limit of quantification were set to zero (and can be used to identify non-detects).
- 6. Other meta-data: meta-data has been standardised.
- 7. Temporal resolution: The temporal resolution of the database is 1 day. Samplings below this resolution have been aggregated by the maximum daily value.
- 8. Validity Checks: Simple rules for validity checks have been implemented.

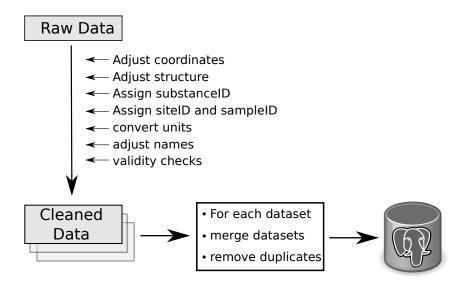

Figure S1: Overview on data cleaning steps. After cleaning, data have been stored in a relational spatial PostgreSQL database.

2 Overview on compiled data

Table S1: Overview on chemical samples. Only data from running waters and grab sampling is shown. ^a: Abbreviations according to ISO 3166-2:DE. ^b: Including metabolites

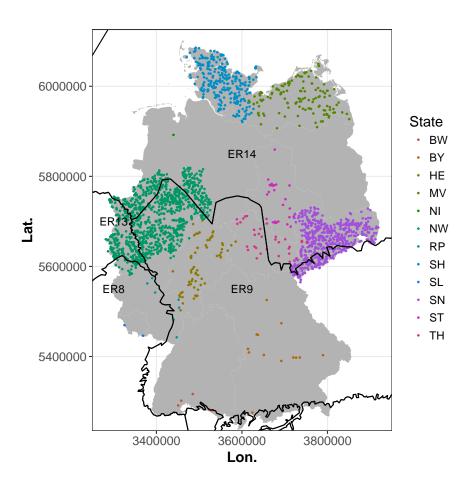

Figure S3: Spatial distribution of the 2,301 small stream sampling sites. Colour codes different federal states (see Supplemental Table S1 for abbreviations). Overlayed are ecoregions. ER4: Alps (no label), ER8: Western highlands, ER9: Central highlands, ER 13: Western plains, ER14: Central plains.

3 Influence of agricultural land use and catchment size

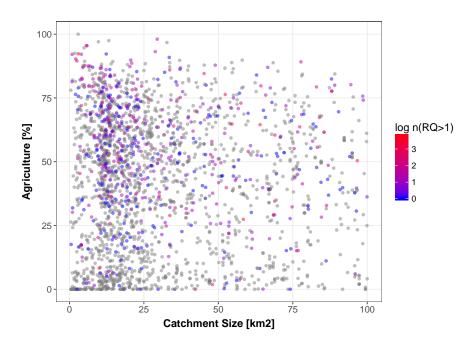

Figure S4: Raw data used for the model in equation 2 and Figure 3 of the main article. Color codes the number of RAC exceedances (on a log-scale). Grey points denote sites without any exceedance.

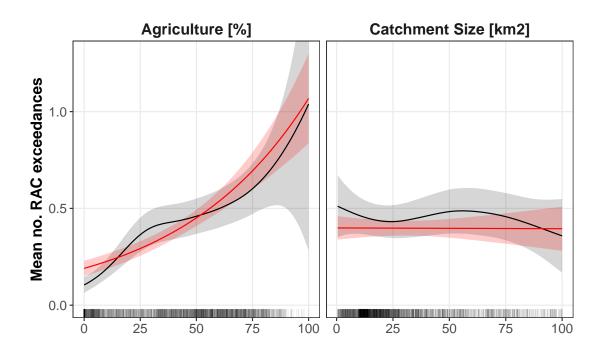

Figure S5: Smooth and linear fits for the data presented in figure 3 of the main article.

4 Effect of precipitation and season on RQ

Table S3: 23 pesticides for which we modelled the relationship between RQ and precipitation and seasonality, respectively. Order is the same as in Figure 5 of the main text. See Table S4 for model coefficients.

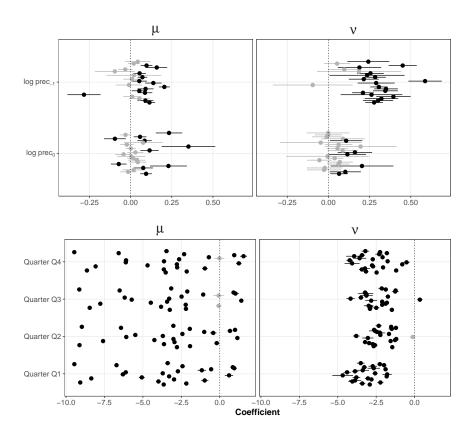

Figure S6: Graphical representation of coefficients from table S4. Top row: Effect of precipitation at the day before sampling and at day of sampling. Bottom row: estimates for the four Quarters. Each dot represents one compound (in the order described in table S3). Coefficients where the CI encompasses zero are shown in gray colour. Coefficients are shown on the link scale (log for μ and logit for ν).

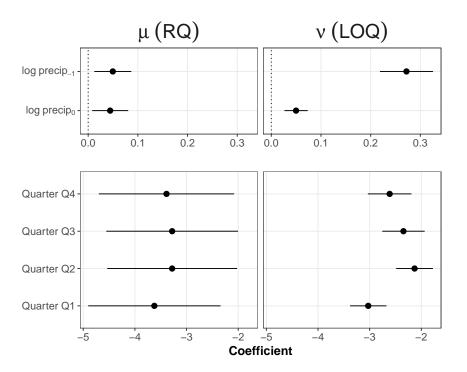

Figure S7: Summarised coefficients (and their 95% CI) for precipitation (top row) and quarter (bottom row) from a meta-analysis of the 22 modelled compounds (see Figure S6). Left: coefficients for mean RQ (μ), right: coefficients for probability of exceeding LOQ (ν). Coefficients are shown on the link scale. Single compound coefficients are provided in Supplemental Table S4 and Figure S7).

5 Pesticides in small streams

Table S5: Overview on RAC exceedances of the 78 compounds with more than 1000 measurements. No. = number of measurements; % RQ >1 = RAC exceedances; % RQ >1 | >LOQ= RAC exceedances as fraction of detects.

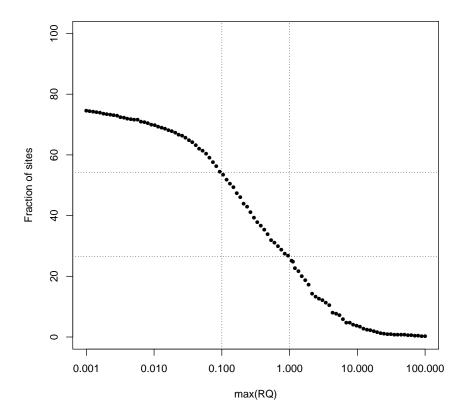

Figure S8: Cumulative distribution of sites exceeding RAC. Dotted lines indicate fraction of sites exceeding a RQ of 1 and 0.1. 23% of the sites showed no detection of compounds with available RAC values and are not shown due to logarithmic x-axis.

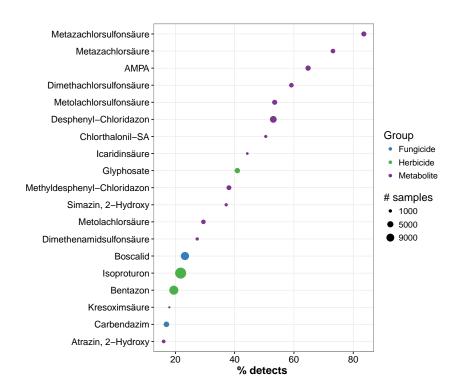

Figure S9: Proportion of samples with detects in small streams. Only Compounds with more than 100 samples and 15% of detects are shown.

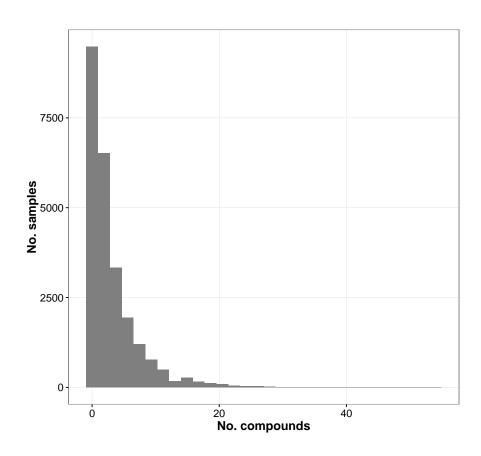

Figure S10: Distribution of the number of quantified compounds in the samples.
